

Part 3 – Website Critique

thinktac.com Homepage Review

Performance

The thinktac.com homepage leans heavily on video: the hero section autoplays an embedded video immediately, and the same video file is then reused six separate times across the six curriculum-tab sections (CBSE Science, CBSE Maths, Science Lab, NCERT Science, NCERT Maths, ICSE Science). Loading one video once and referencing it would be simple; loading it six times, even if the browser caches it, adds unnecessary weight to a page that already opens with an autoplaying hero video competing for bandwidth. Several images, including school-board and award logos, are also served without any visible lazy-loading attribute, so below-the-fold logos load alongside above-the-fold content.

User Experience / Product Gaps

The page structure buries the value proposition under a long, uniform scroll: hero, partner logos, curriculum grid, six repeated video/tab blocks, philosophy section, testimonial stat, and footer. There is no secondary call-to-action until the very bottom, so a visitor who does not convert on the first “Get Started” button has to scroll past six near-identical tabbed sections before seeing another prompt. The header markup also shows default cart-state text (“Item added to your cart”, “Check out”, “Continue shopping”) present even before any product is added, which could confuse a first-time visitor glancing at the top of the page.

One Concrete Suggestion

Replace the six duplicate embedded video instances with a single shared video element whose source swaps on tab-click, or lazy-mount the video only when its tab becomes active. This removes five redundant video downloads from the initial page load, which is a larger and more measurable win than a CSS-only tweak, and is a same-day fix for whoever owns the tab component.
